# Предельные расстояния связи и обнаружения

$$\Theta \sim \lambda/D$$

$$\Omega_{\Theta} = \pi\Theta^2 = \pi(\lambda/D)^2$$

$$g_1 = \frac{4\pi}{\Omega_{\Theta}} = \frac{4D^2}{\lambda^2} = \frac{16S_1}{\pi\lambda^2}$$

$$P_2 = S_2 \frac{g_1 P_1}{4\pi R^2} = \frac{4S_1 S_2 P_1}{\pi^2 \lambda^2 R^2}$$

$$P_{ns} = kT_{ns} \Delta f$$

$$\alpha = \frac{P_2}{P_{ns}} = \frac{4S_1 S_2 P_1}{\pi^2 \lambda^2 R^2} \frac{1}{kT_{ns} \Delta f}$$

$$R = \sqrt{\frac{4S_1 S_2 P_1}{\alpha \pi^2 \lambda^2} \frac{1}{kT_{ns} \Delta f}}$$

- $\alpha \sim 1$  – уверенный обмен информацией
- $\alpha \ll 1$  – обнаружение несущей

Аресибский планетный радар:

$$S_1 = S_2 = 10^5 \text{ м}^2;$$

$$P_1 = 10^6 \text{ Вт};$$

$$\lambda = 3 \text{ см};$$

$$\Delta f = 1 \text{ Гц};$$

$$T_{ns} = 10 \text{ К}^\circ$$

$$\alpha = 1 \Rightarrow$$

$$R = 19100 \text{ св. лет}$$

Аэродромный/военный радар:

$$S_1 = 10^2 \text{ м}^2; S_2 = 10^5 \text{ м}^2;$$

$$P_1 = 5 \times 10^4 \text{ Вт};$$

$$\lambda = 3 \text{ см};$$

$$\Delta f = 1000 \text{ Гц};$$

$$T_{ns} = 10 \text{ К}^\circ$$

$$\alpha = 1 \Rightarrow$$

$$R = 4.3 \text{ св. лет}$$

## Обнаружение

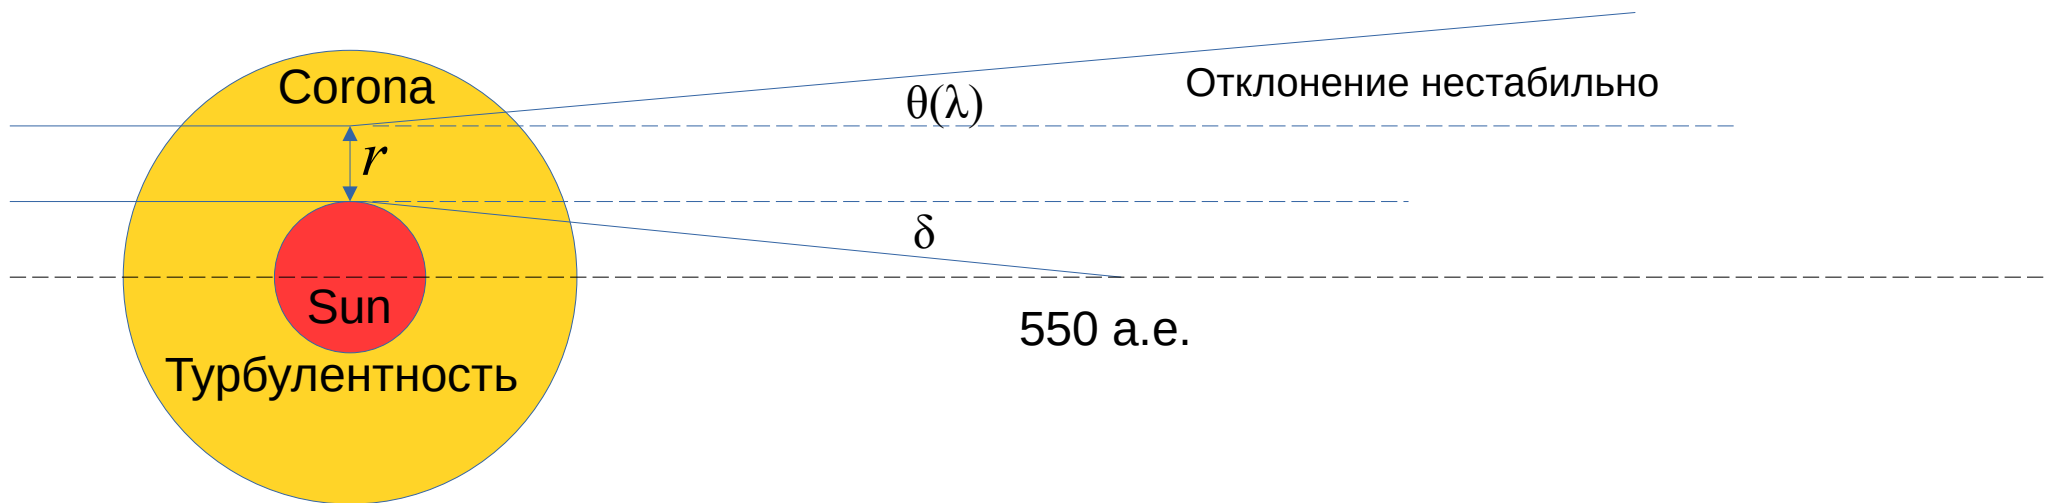

$$\alpha \sim 0.01$$

$$R = 43 \text{ св. лет}$$

$$S_2 = 10^9 \text{ м}^2,$$

$$D_2 = 30 \text{ км}$$

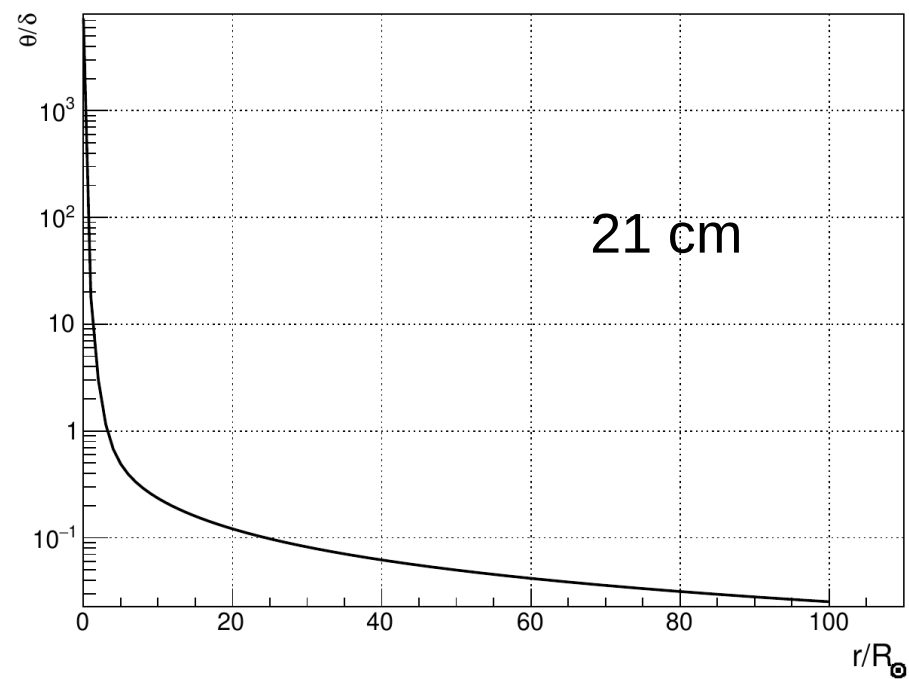

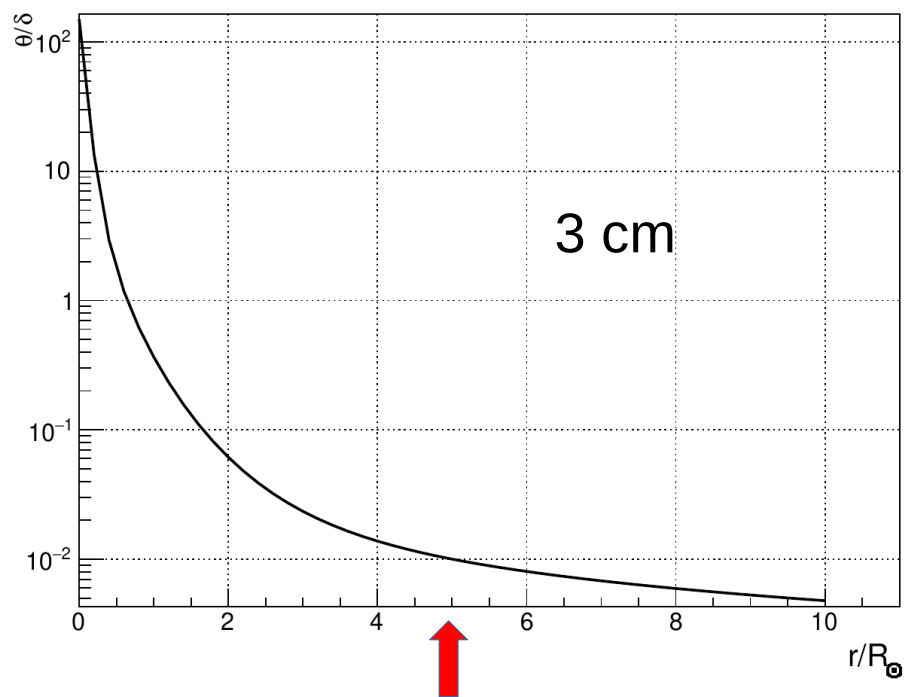

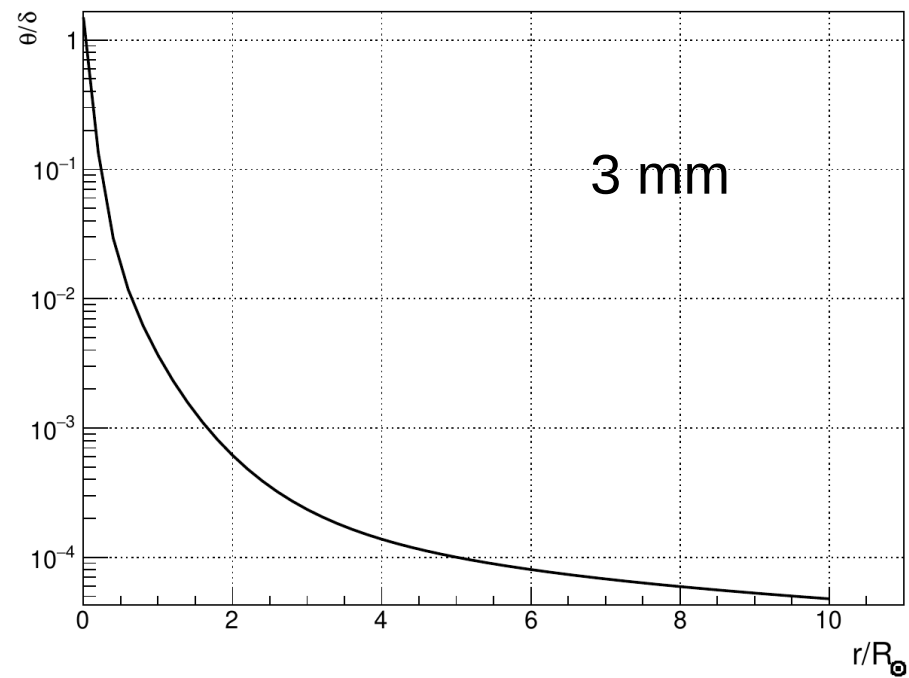

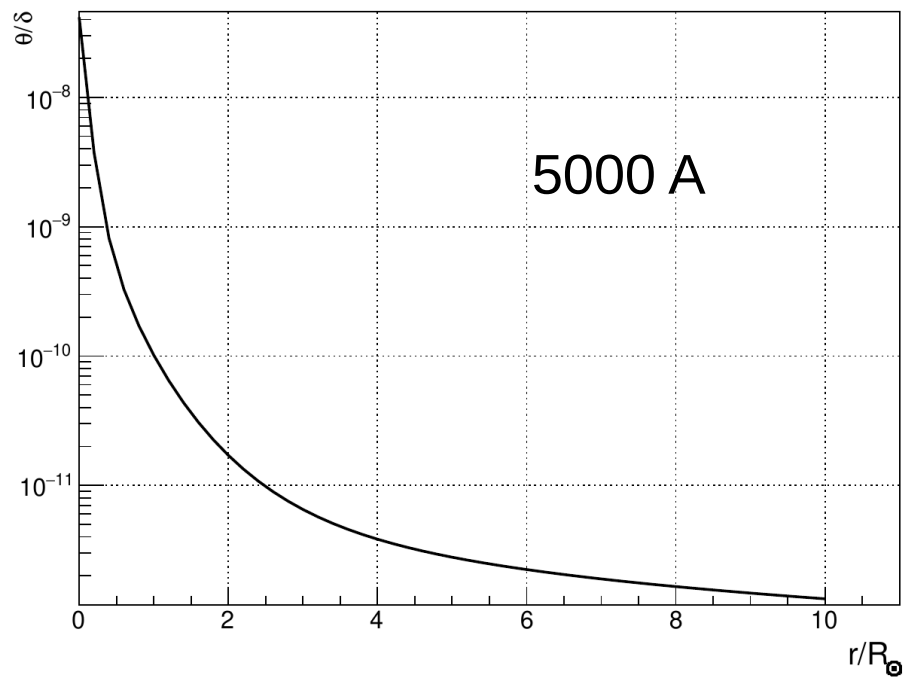

$$R = 4300 \text{ св. лет}$$

$$b = 1 + \frac{r}{R_{\odot}} \quad \delta = 2 \frac{R_g}{R_{\odot}} \frac{1}{b}$$

$$\theta = \left( \frac{6.32 \text{ MHz}}{\nu} \right)^2 \left( \frac{2.952 \cdot 10^3}{b^{16}} + \frac{2.28 \cdot 10^2}{b^6} + \frac{1.1}{b^2} \right)$$

$$\frac{\theta}{\delta} \propto \frac{1}{b}$$

Гравитоскоп на волну  $\lambda = 3 \text{ см}$

$$r/R_{\odot} = 5$$

$$\theta/\delta = 0.01$$

$$L \approx 20000 \text{ а.е.} = 110 \text{ св. дней}$$

$$D_{\text{ЭКВ}} = 260 \text{ км для диаметра антенны 4 м.}$$

Для скорости  $1/40 c$  время полета в фокус 12 лет

STARSHOT

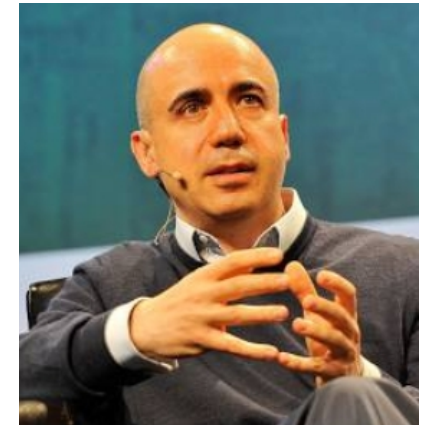

<https://breakthroughinitiatives.org/initiative/3>

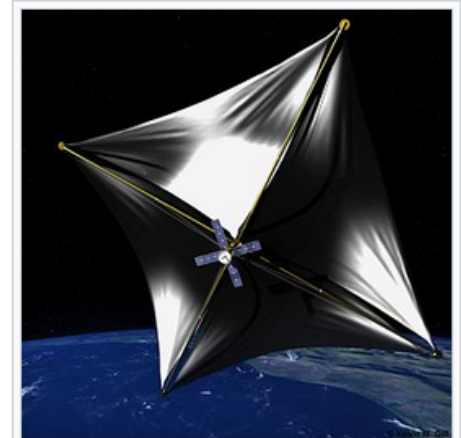

Concept [\[edit\]](#)

The Starshot concept envisions launching a "mothership" carrying about a thousand tiny spacecraft (on the scale of centimeters) to a high-altitude Earth orbit for deployment. A [phased array](#) of ground-based lasers would then focus a light beam on the crafts' sails to accelerate them one by one to the target speed within 10 minutes, with an average acceleration on the order of  $100 \text{ km/s}^2$  (10,000 [g](#)), and an illumination energy on the order of  $1 \text{ TJ}$  delivered to each sail. A preliminary sail model is suggested to have a surface area of  $4 \text{ m} \times 4 \text{ m}$ .<sup>[19][20]</sup> An October 2017 presentation of the Starshot system model<sup>[21][22]</sup> examined circular sails and finds that the beam director capital cost is minimized by having a sail diameter of 5 meters.

The Earth-sized planet Proxima Centauri b is within the Alpha Centauri system's [habitable zone](#). Ideally, the Breakthrough Starshot would aim its spacecraft within one [astronomical unit](#) (150 million kilometers or 93 million miles) of that world. From this distance, a craft's cameras could capture an image of high enough resolution to resolve surface features.<sup>[23]</sup>
